# Color a black and white photo

Photos found under photo library, digital painting images

For each color you add to your black and white picture, you will need to create a **new layer** so you can edit your colors better

Add your colors using the brush and selection tools

Then edit your colored layers (remember to name them! — name your layers by double clicking on them)

Change the layer setting from normal to <u>overlay</u> or <u>soft light</u>

Use multiple colors and layers to color in your image!
